

FOR IMMEDIATE RELEASE

### EJ-Projects Licenses VABS for Composite Rotor Blade Simulation

Salt Lake City, Utah (USA), September 7, 2017. [AnalySwift, LLC](#), a provider of efficient high-fidelity modeling software for composites and other advanced materials, announced today that EJ-Projects has licensed its VABS software for use in simulating composite rotor blades.

Based in the Netherlands, EJ-Projects is an engineering consultancy with specialties in modeling and simulation, loads, aerodynamics and structural engineering. The company's primary focus is in aerospace, turbo machinery, and wind power technologies, and EJ-Projects has licensed VABS for composite rotor blade analysis projects, including an off-shore wind turbine project.

"We have had a relationship with EJ-Projects for some time and have been impressed with the work they have done, particularly in composite rotor blade analysis," said Alan Wood, president and CEO of AnalySwift. "VABS proved to be a uniquely rigorous solution as a general purpose cross-sectional analysis tool for computing beam sectional properties and recovering 3D fields of slender composite structures. This includes composite helicopter and wind turbine rotor blades, as well as other slender composite parts, such as landing gear, propellers and high-aspect ratio wings."

"EJ-Projects uses VABS together with GEDT, an open source comparison code to VABS, in design analysis focused on rotor blade dynamics," said Eric Jensen of EJ-Projects. "Together with industry standard integrated load analysis software, EJ-Projects also employs VABS for design and certification of offshore wind turbines."

"VABS is capable of rigorously decoupling an original 3D slender solid with complex cross-sections into a simple engineering beam model," according to Dr. Wenbin Yu, CTO of AnalySwift. "With continuous development funded by the US Army spanning over 20 years for performance and robustness, VABS' accuracy has been extensively verified by its developers and users."

#### About EJ-Projects

EJ-Projects B.V. provides high end technology solutions and advanced structural design analysis services. The project experience includes long-term collaborations with established OEMs and technology start-up companies in product development programs for offshore and offshore wind turbines, industrial compressors and gas turbines, rotorcraft, regional jets, turbo fan and turbo prop engines and landing gears.
